1907-2007

# Dust Falls Straight to the Floor!

If you've sanded drywall compound, you know drywall dust goes everywhere and settles on everything; not to mention clogging masks and coating goggles. It's a mess that takes hours, even days, to clean up. Well finally, there's a solution.

CGC is pleased to introduce a revolutionary new drywall compound that dramatically reduces airborne dust. Its unique "heavy dust" particles bind together and drop straight to the floor, ready to vacuum or sweep up in no time at all. That's good, clean science that makes for less prep and fast, easy cleanup.

And there's no sacrifice in performance. DUST CONTROL™ Drywall Compound provides outstanding performance for any drywall finishing application:

- The compound provides low shrinkage, weighs 15% less than conventional joint compounds and usually requires just two coats over beads and trim.
- DUST CONTROL has excellent bond for both taping and finishing coats.
- You get an advanced product that works and sands very easily. It is a true all purpose product.

So whether you're a renovation contractor trying to keep your customers happy or a do-it-yourselfer trying to keep the house a little cleaner, all you need to remember is "With DUST CONTROL, dust falls straight to the floor!"

## FAQ's

### How is dust control compound different from all other compounds?

DUST CONTROL Drywall Compound by CGC provides the same or better performance to other CGC drywall compounds but creates less airborne dust when sanded.

### How does it work?

Innovative science. The compound's patented formulation technology binds up fine sanding residue to form heavier particles that fall straight to the floor instead of clouding the air. This innovation also keeps the dust down when sweeping.

### How's its performance?

DUST CONTROL Drywall Compound performs as well or better than the leading drywall compounds with excellent bond and low shrinkage. DUST CONTROL is a lightweight material that can cover beads and fasteners in two coats.

### Where does it work best?

The compound can be used for all drywall finishing applications. It's ideal for any job in any place where cleanliness is desired, like residential and commercial renovation and repair jobs.

### Can I use it for all joint finishing, including taping and finish coats?

Yes, use for all steps in drywall finishing including beads and trims. It has excellent bond for taping.

### What kind of sandpaper should I use?

General purpose sandpaper can also be used; however, higher quality Aluminum Oxide paper, 150 grit or higher, will provide the best results. These products feature heavier-grade paper and more uniformly bonded grit, making them less susceptible to sandpaper clogging, which can result in uneven sanding.
